

Drain, Sewer, Interceptor & Lagoon Cleaning

Mantank Environmental Services Limited has the specialist equipment and personnel necessary to enable the cleaning and removal of waste from drains, sewers, interceptors & lagoons.

Our expertise in this field, the training undertaken by our staff and the construction of our equipment allows for the cleaning and decontamination of both hazardous and non-hazardous contaminants.

Prior to any cleaning it is imperative to understand fully the job to be done which, is why our teams will carry out a site survey, risk assessment, produce a method statement and analyse the waste to be removed.

This will ensure we have the correct equipment necessary to carry out the job in the most environmentally friendly and cost effective way possible.

Mantank have the capabilities to provide our clients with a single source for critical support services, including:

- Industrial Cleaning and Maintenance
- Environment and Waste Services
- Transportation Services
- Onsite Services
- Emergency Response.

Equipment

We operate with a wide range of equipment capable of cleaning and decontaminating even the most arduous of jobs.

Mantank's equipment includes high volume/ low pressure or low volume/ high pressure water jetting units fitted to our fleet of vehicles. Our tankers have barrels manufactured from mild steel or stainless steel. These may be coated with specialist linings to enable us to remove both hazardous & non hazardous waste.

Our fleet of liquid ring pump tanker units enables us to remove large volumes of liquid waste quickly and efficiently. Whilst our jetter recycling units have the capability to operate as an air mover or conventional vacuum unit together with the continuous recycling of jetting water. This enables the unit to spend more time on the cleaning process before replenishing the jetting water.

If large volumes of waste are to be uplifted from lagoons or interceptors the waste can be processed on site using our mobile or static filter presses. The role of the modern day filter press is to remove the filtrate from the sludge and change it into a dry filter cake. The filtrate can either be reused on site or disposed of to drain vastly reducing disposal costs.

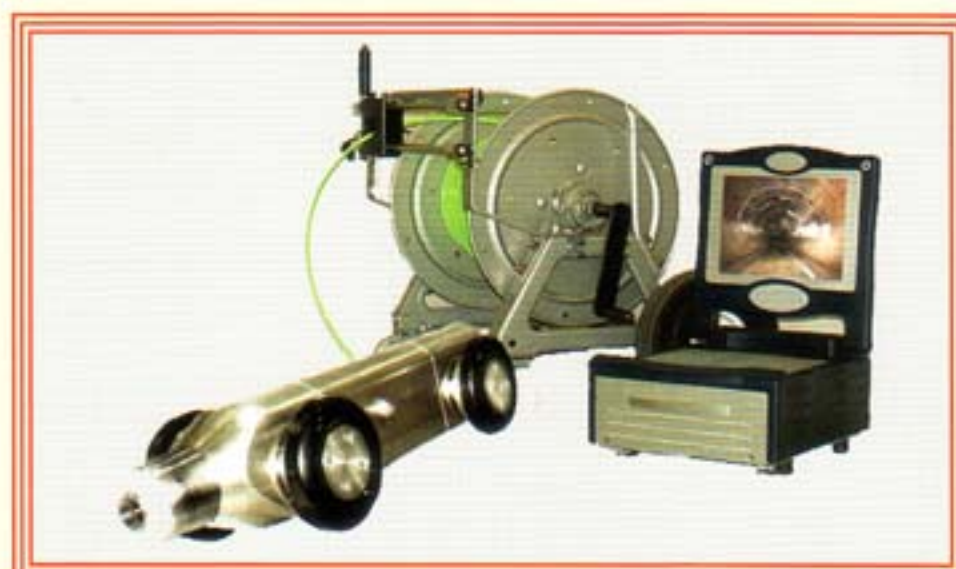

Over a period of time deterioration of drains and sewers can take place for many different reasons. By providing a CCTV survey, Mantank can quickly identify the reason for the problem and allow recommendations to be made on the best possible solution.
